

STOP FREEZING VACCINE!

Ice-Lined Refrigerator

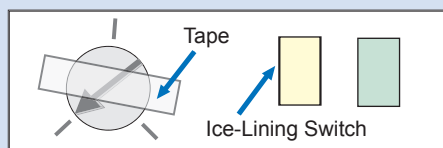

- ▶ Keep freeze-sensitive vaccines 20 cm away from the bottom of the refrigerator.
- ▶ Do not let freeze-sensitive vaccines touch the walls of the refrigerator.
- ▶ Leave space between the vaccine boxes to allow air to circulate.
- ▶ Place a thermometer and a Freeze Watch™ indicator among the freeze-sensitive vaccines.

Fill the bottom with water bottles or foam spacers to keep vaccines away from the bottom.

Monitor the Temperature

▶ Set ILR Controls Properly

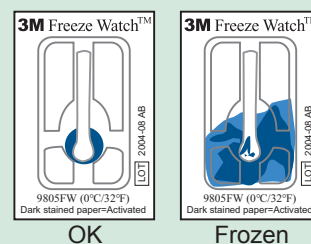

If there is an ice-lining switch, turn it OFF.

Adjust the thermostat:

1. Set the thermostat to MEDIUM, and tape.
2. If after 3 days the temperature is less than 2°C at any time, reduce thermostat to MINIMUM power setting.

Do not adjust the thermostat after power cuts or if the temperature occasionally rises above 8°C.

▶ Freeze Watch™

Check the Freeze Watch™ indicators morning and evening.

If the absorbing paper turns blue, test the vaccines for freezing by using the shake test.

Supported by PATH's USAID-funded HealthTech program and its Children's Vaccine Program.

Freezing damages DPT, TT, DT, and Hep B vaccines!
